How to add custom font family in android studio. How to use font family in android. How to add font family in android studio. Font family list in android studio. How to change font family in android studio. How to apply font family in android studio. What are the five font families.

In android, you can define your own custom fonts for the strings in your application. You just need to download the required font from the internet, and then place it in assets/fonts folder. After putting fonts in the assets folder under fonts folder, you can access it in your java code through Typeface class. First, get the reference of the text view in the code. Its syntax is given below – TextView tx = (TextView)findViewById(R.id.textView1); The next thing you need to do is to call static method of Typeface class createFromAsset() to get your custom font from assets. Its syntax is given below – Typeface custom\_font = Typeface.createFromAsset(getAssets(), "fonts/font name.ttf"); The last thing you need to do is to set this custom font object to your TextView Typeface property. You need to call setTypeface() method to do that. Its syntax is given below – tx.setTypeface(custom\_font); Apart from these Methods, there are other methods defined in the Typeface class, that you can use to handle Fonts more effectively. Sr.No Method & description 1 create(String familyName, int style) Create a Typeface object given a family name, and option style information 2 create(Typeface family, int style) Create a Typeface object that best matches the specified existing Typeface and the specified Style 3 createFromFile(String path) Create a new Typeface from the specified font file 4 defaultFromStyle(int style) Returns one of the default Typeface objects, based on the specified style 5 getStyle() Returns the Typeface's intrinsic style attributes Example Here is an example demonstrating the use of Typeface to handle CustomFont. It creates a basic application that displays a custom font that you specified in the fonts file. To experiment with this example, you can run this on an actual device or in an emulator. Steps Description 1 You will use Android studio IDE to create an Android application under a package com.example.sairamkrishna.myapplication. 2 Download a font from internet and put it under assets/fonts folder. 3 Modify src/MainActivity.java file to add necessary code. 4 Modify the res/layout/activity\_main to add respective XML components 5 Run the application and choose a running android device and install the application on it and verify the results Before entering to code part add fonts in assets folder from windows explorer. Following is the content of the modified main activity file MainActivity.java. package com.example.sairamkrishna.myapplication; import android.graphics.Typeface; import android.support.v7.app.AppCompatActivity; import android.os.Bundle; import android.widget.TextView; public class MainActivity extends AppCompatActivity { TextView tv1,tv2; protected void onCreate(Bundle savedInstanceState) { super.onCreate(savedInstanceState); setContentView(R.layout.activity\_main); tv1=(TextView)findViewById(R.id.textView3); tv2=(TextView)findViewById(R.id.textView4); Typeface face= Typeface.createFromAsset(getAssets(), "font/font.ttf"); Typeface face1= Typeface.createFromAsset(getAssets(), "font/font1.ttf"); tv2.setTypeface(face1); } } Following is the modified content of the xml activity\_main.xml. Following is the content of the res/values/string.xml. My Application Following is the content of AndroidManifest.xml file.
